

CLAIMS

What is claimed is:

- 5 1. A method for authentication and log-in to a system, comprising:
 performing a biometric scan of a user with a wireless biometric device
 comprising a wireless proximity detection device coupled to a biometric device;
 comparing the biometric scan of the user to stored biometric data to authenticate
 the user; and
10 authenticating the user.
2. The method of claim 1, further comprising logging the user into the
 system.
- 15 3. The method of claim 3, further comprising sending a signal to the
 system from the wireless biometric device to log the user into the system.
4. The method of claim 4, further comprising sending user identification
 information to a system interface antenna; and comparing the user identification
20 information to an appropriate user database to log the user into the system
5. The method of claim 1, wherein the biometric scan comprises at least
 one of a thumbprint scan, a fingerprint scan, a handprint scan, a retinal scan, a voice
 recognition, and a facial recognition.
25 6. The method of claim 1, wherein the system is a picture and archival
 communication system (PACS) and an interface of the system is a PACS workstation.
7. The method of claim 1, wherein the system is a medical modality system
30 and the interface of the system is an operator interface of the medical modality system.

8. The method of claim 6, wherein the medial modality system is an imaging system.

9. A method of accessing a system, comprising:
5 scanning a user with a wireless biometric device;
recognizing biometric measurements of the user and authenticating the user to permit access by the user to the system;
sending a wireless signal to a system device and communicating to the system user identification code; and
10 logging the user into the system based on the user identification code.

10. The method of claim 9, wherein the system device is an antenna configured to receive a wireless signal.

15 11. The method of claim 9, further comprising comparing the user identification code to stored identification code data to log the user into the system.

12. The method of claim 9, wherein the biometric device utilizes at least one of a thumbprint scan, a fingerprint scan, a handprint scan, a retinal scan, a voice
20 recognition, and a facial recognition.

13. The method of claim 9, wherein the system is a picture and archival communication system (PACS) and an interface of the system is a PACS workstation.

25 14. The method of claim 9, wherein the system is a medical modality system and the interface of the system is an operator interface of the medical modality system.

15. A method of logging into a system, comprising:
activating a proximity detection device by satisfying a required biometric
30 measurement;

receiving user identification data from the proximity detection device to the system via a wireless connection; and
logging a user into the system.

5 16. The method of claim 15, wherein a user is scanned with a biometric device integrated with the wireless proximity detection device to activate the wireless proximity detection device.

10 17. The method of claim 16, wherein biometric measurements of the user are compared to stored measurement data to authenticate the user, to satisfy the required biometric measurement, and to activate the wireless proximity detection device.

15 18. The method of claim 16, wherein the biometric device utilizes at least one of a thumbprint scan, a fingerprint scan, a handprint scan, a retinal scan, a voice recognition, and a facial recognition.

 19. The method of claim 15, wherein the system is a picture and archival communication system (PACS) and an interface of the system is a PACS workstation.

20 20. An authentication and log-in system for accessing a secured system, comprising:

 a wireless biometric device comprising a wireless proximity detection pin coupled to a biometric device;

25 a sensor disposed in the biometric device for performing a biometric measurement of a user;

 a processing module disposed within the wireless biometric device for conducting the biometric measurement of a user, authenticating the user, and transmitting a wireless communication of authenticated user identification code to the secured system;

30 a device disposed in the secured system for receiving the authenticated user identification code; and

a log-in module disposed within the secured system for comparing authenticated user identification code to stored identification code and for logging the user into the secured system.

5 21. The system of claim 20, wherein the biometric device is at least one of a thumbprint scanner, a fingerprint scanner, a handprint scanner, a retinal scan, a voice recognition device, and a facial recognition device.

10 22. The system of claim 20, wherein the system is a picture and archival communication system (PACS) and an interface of the system is a PACS workstation.

 23. A system for authentication and log-in to a system, comprising:
 means for performing a biometric scan of the user with a wireless biometric
device comprising a wireless proximity detection device coupled to a biometric device;
15 means for comparing the biometric scan of the user to stored biometric data to
authenticate the user; and
 means for authenticating the user.

 24. A system of accessing a system, comprising:
20 means for scanning a user with a wireless biometric device;
 means for recognizing biometric measurements of the user and authenticating
the user to permit access by the user to the system;
 means for sending a wireless signal to a system device and communicating to the
system user identification code; and
25 means for logging the user into the system based on the user identification code.

 25. A system of logging into a system, comprising:
 means for detecting proximity of a user by satisfying a required biometric
measurement;
30 means for receiving user identification data from the detecting means to the
system via a wireless connection; and

means for logging a user into the system.

26. A computer program for authentication and log-in to a system, comprising:

5 at least one computer readable medium; and

computer readable codes stored on the at least one medium for performing a biometric scan of the user with a wireless biometric device comprising a wireless proximity detection device coupled to a biometric device, comparing the biometric scan of the user to stored biometric data to authenticate the user, and authenticating the user.

10 27. A computer program for authentication and log-in to a system, comprising:

at least one computer readable medium; and

15 computer readable codes stored on the at least one medium for scanning a user with a wireless biometric device, recognizing biometric measurements of the user and authenticating the user to permit access by the user to the system, sending a wireless signal to a system device and communicating to the system user identification code, and logging the user into the system based on the user identification code.

20 28. A computer program for authentication and log-in to a system, comprising:

at least one computer readable medium; and

25 computer readable codes stored on the at least one medium for activating a proximity detection device by satisfying a required biometric measurement, receiving user identification data from the proximity detection device to the system via a wireless connection, and logging a user into the system.
